**Abstract:** *Habenaria myriotricha* Gagnep(Oncidaceae) is reported from China for the first time. The species is characterized by its side-lobes divided into many linear lobules. It differs from the *Habenaria medioflexa* Turrill. by its reflexed lateral sepals and lip often with some red rusty spots at the base.

**Key words:** *Habenaria myriotricha*; Orchidaceae; new record; China

**CLC Number:** Q949    **Document Code:** A    **Article ID:** 1000-3142(2012)04-0440-02

## 中国兰科玉凤花属一新记录种——勐远玉凤花

**摘要:** 报道了中国云南兰科植物一新记录种, 勐远玉凤花(*Habenaria myriotricha* Gagnep.)。该种主要特点是唇瓣侧裂片的外侧几乎至基部具多数深的线状裂条。其侧萼片反折, 唇瓣上具有红色锈斑可与版纳玉凤花(*H. medioflexa* Turrill.)明显区别开。

Terrestrial or rarely epilithic, deciduous, glabrous. Stem 19—40 cm tall. Leaves 4—5, caudate, spreading, lanceolate, acute or acuminate, mucro-

nate, 8—15 cm long, 2—2.5 cm wide. Inflorescences lax, few flowered; rachis 3—4 cm long; infertile bracts foliaceous, 1—3, erect, lanceolate-ovate, acuminate, 3—4.4 cm long; fertile bracts narrowly lanceolate, acuminate, 1.5—2.5 cm long, 3 mm wide. Flowers white with green sepals and petals, lip often with some red patches at the base. Ovary(including pedicel) 2—4 cm long. Sepals acute, 3-veined; dorsal sepal erect, ovate, 8—8.5 mm long, and 4—4.2 mm wide; lateral sepals spreading to somewhat reflexed, obliquely ovate, 7.5—11.5 mm long, 4.75—4.9 mm wide, basally united with the lip. Petals erect, forming a hood with the dor-

1. 7–3 mm long, straight projecting forwards.

Distribution: Thailand, Laos, Vietnam and China.

China. Yunnan: Mengla, Mengyuan, epiphytic on the limestone, 1 000 m, October 3, 2010, Li-Jian-wu 424 (holotype, HITBC139354).

*Habenaria myriotricha* was first named by Kraenzl in 1893, called *Habenaria medusa*. However, the taxonomy of *Habenaria myriotricha* alliance was confused (Kurzweil, 2009). Here we follow current opinion about this species. Kew's World Checklist of Monocotyledons (<http://www.kew.org/wcsp/> monocots/), Schuiteman *et al.* (2008) and Cavestro (2007) consider the two taxa as conspecific. The specimens from Yunnan represented the first record of this species in China. *Habenaria myriotricha* is related to *Habenaria*

*medioflexa* Turrill (Lang, 1999), but differs from the latter by its reflexed lateral sepals and lip often with some red rusty spots at the base.

**Acknowledgements** We are grateful to Prof. JIN Xiao-Hua for his critical reading of the manuscript.
